

Where the exported objects occur

Coordinate reconstruction; not a microscopy image. 1,067,281 objects in their shared coordinate frame.

Each position is a bounding-box midpoint. Square bins: 250 × 250 exported coordinate units. All rows contribute; no sampling.
Pale background = no plotted detections; analyzed ROI boundaries and coordinate calibration are unavailable. Counts are not tissue density.
No smoothing. No fluorescence intensities, tissue pixels, or object contours are reconstructed.
