

How much of each PLA object overlaps ChAT

Coordinate reconstruction; not a microscopy image. Shared spatial and color scales; gray = ChAT counts.

Each position is a bounding-box midpoint. Square bins: 1000 × 1000 exported coordinate units. All rows contribute; no sampling.
Pale background = no plotted detections; analyzed ROI boundaries and coordinate calibration are unavailable. Counts are not tissue density.
Proportion colors require ≥ 10 raw PLA objects/bin; blank color can indicate insufficient support.
No smoothing. No fluorescence intensities, tissue pixels, or object contours are reconstructed.
